ASSIGNMENT-1

MVC (Model view - controller)

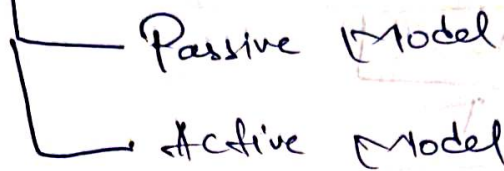

It is a Software design pattern that separates application logic into three interconnected components

Standard MVC Structure

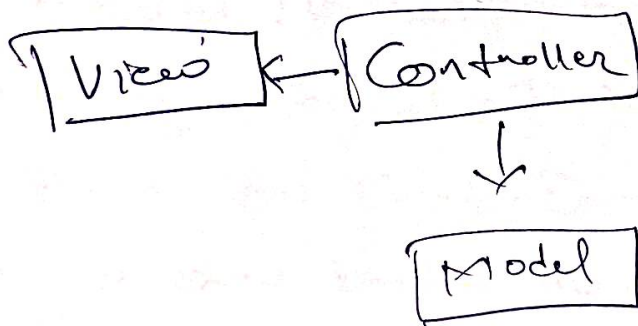

MVC Variants

Passive Model :-

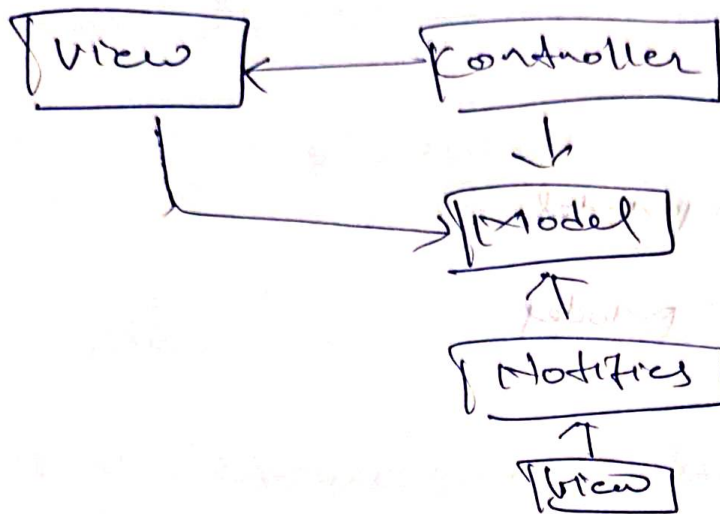

- Model unaware of view/controller. It views polls model for changes or is notified by controller.

- It is used in simpler system. No real time data updates needed.

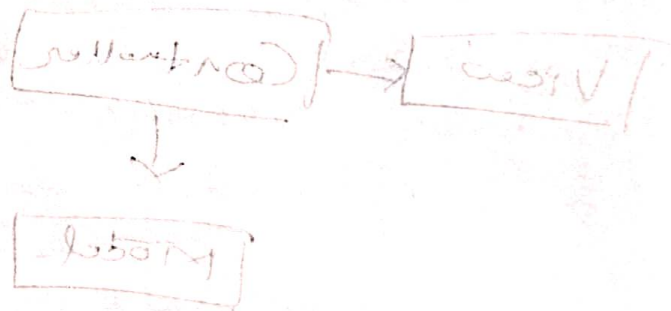

Active Model

- Model actively notifies view when it changes
- Enable, real time UI updates
- You need dynamic UIs that respond to live data
- & web apps with frequently updates

It is used in simpler system. No need of data objects. Controller is notified of changes or it notifies the view. It is not necessary of view controller. It is not necessary of view controller.

Active Model

- Model actively notifies view when it changes
- Enable test drive development

- You need to have a lot of test code to test the model. It is not necessary of view controller. It is not necessary of view controller.
