

Name - Shaikh Faran
Regd no - 2141006001

Task-1

- **Process Scheduler:** - The scheduler decides which gets to use the CPU and for how long it. Ensures efficient multitasking and fair resource distribution among processes.
- **Memory management:** - This manages memory allocation and paging. It tracks which memory is used by which process and handles swapping between RAM and disk when needed.
- **Virtual file system:** - This VFS acts as an abstraction layer for various file systems (e.g., ext4, NTFS). It provides a uniform interface for applications to access files.
- **Network stack:** - The network stack implements protocols like TCP/IP. It manages data transmission over the network, allowing processes to communicate through sockets & APIs.
